reinforced by the observation that potential N-glycosylation sites are located in the carboxy side of the hydrophobic core. Therefore the N-terminal 6 AAs are predicted to be cytoplasmic, the next 22 AAs are predicted to transverse the cytoplasmic membrane, and the 738 C-terminal AAs constitute the predicted extracellular domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       273 -----YDIEQGRLTCLTEMLDVHLADALIGDSLIGG-AEQRPIWTKDSQGFY-VIGTDQG

The invention is concerned with molypeptide fragments and analogues of CD26 which have internal deletions (see also AAR34612-14). The analogues pref. lack residues 3 st or 24.34. These analogues are analogues pref. lack residues 3 st or 24.34. These analogues are soluble under physiological conditions and lack enough amino acid residues to render them susceptible to cleavage by signal peptidase. The peptide fragments and analogues are useful as immune or responserium peptide fragments and analogues are useful as immune or responsedimentating therapeutics, eg. they may be used for treatment of disease conditions characterised by immunosupression, eg. AIDS or AIDS-related complex, other virally or environmentally-induced complex, other virally or environmentally-induced complex increase immune deficiencies. The peptides conditions, and certain congenital immune deficiencies. The peptides can be employed to increase immune function which has been impaired by use of immunosupressive drugs, such as certain chemotherapeutic drugs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ----YDIEQGRLTCLTEMLDVHLADALIGDSLIGG-AEQRPIWTKDSQGFY-VIGTDQG 325

(a) Ala, Arg, Asp, Gly and/or Val, or (b), if the substrate has been deamidated, in Glu (free and/or peptide bound), in which case products are useful as animal feed additives. DpAP can also be used in flavouralso for deactivating enzymes and for converting AP) and in dough pre-mixes, proteins. DPAP increases the level of hydrolysis of proteins and thus proteins. DPAP increases the level of hydrolysis of proteins and thus flavour development, and a mixture with AP may hydrolyse tripeptides that are resistant to either enzyme used alone. PH have improved them have better flavour, palatability, mouthfeel, aroma and crust
                                                                                                                                                                                                                                                                                                                                                                                                                                                             220 detfevnlggnrflyegveftvstvginykldklifgtnlesefrhsskgfywikdlntg 279

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents a prolyl tripeptidyl-peptidases from Porphyromonas gingivalis, which is designated PTP-A. The prolyl tripeptidyl-peptidase has an amidolytic activity, and cleaves a peptide bond in a target polypeptide having at least 4 amino acids. This bond is between a proline and a mino acid attached to the alpha-carboxyl group end of the proline. The polypeptide is useful for identifying inhibitors. These inhibitors are then useful for perducing the growth of bacterium or for protecting an animal from a periodontal disease such as gingivitis and periodontitis caused by

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

acylaminoacyl-peptidase (EC 3.4.19.1) [validated] - pig
Alternate names: acyl-peptide hydrolase; acylamino-acid-releasing enzyme
C;Species: Sus scrofa domestica (domestic pig)
C;Date: 30-Jun-1993 #sequence_revision 30-Jun-1993 #text_change 21-Jul-2000

FUNCTION. HAS NO DIPEPTIDYL AMINOPEPTIDASE ACTIVITY. THE LACK OF ACTIVITY MAY BE DUE TO THE SUBSTITUTION OF AN ASPARTATE RESIDUE FOR THE SERINE RESIDUE IN THE PROPOSED CATALYTIC TRIAD.

SUBSCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN (PROBABLE).

SUBSCELLULAR LOCATION: TYPE II MEMBRANE PROTEIN (PROBABLE).

ALTERNATIVE PRODUCTS: 2 ISOFORMS: DPPX-L (SHOWN HERE) AND DPPX-S; ARE PRODUCED BY ALTERNATIVE SPLICING.

TISSUE SPECIFICITY: DPPX-S IS EXPRESSED IN BRAIN AND SOME PERIPHERAL TISSUES INCUDING KIDNEY, OVARY, AND TESTIS; IN CONTRACT DPPX-L IS EXPRESSED ALMOST EXCLUSIVELY IN BRAIN.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY S9B; ALSO KNOWN AS THE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                N-LINKED (GLCNAC. ) (POTENTIAL).

HAS NO DIPEPTIDYL AMINOPEPTIDASE ACTIVITY. THE LACK OF ACTIVITY MAY BE DUE TO THE SUBSTITUTION OF AN ASPARTATE RESIDUE FOR THE SERINE RESIDUE IN THE PROPOSED CATALYTIC TRIAD.

ALTERNATIVE PRODUCTS: 2 ISOFORMS; DPPX-L (SHOWN HERE) AND DPPX-S; ARE PRODUCED BY ALTERNATIVE SPLICING.
